ORACLE Academy

Objectives

- This lesson covers the following objectives:
 - -Understand the effects of multiple constructors in a class
 - -Define overloading of a method
 - -Explain the method signature
 - -Understand when overloading is and isn't possible

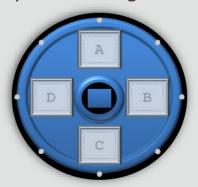

JFo 7-4 Overloading Methods

Exercise 1

- Play Basic Puzzle 8
 - https://objectstorage.ca-toronto-1.oraclecloud.com/n/yzr73ksbiwdp/b/Games/o/JavaPuzzleBaII/index.html
- Consider the following:
 - -What can you say about the lights surrounding each wheel?

JFo 7-4 Overloading Methods

Why Did We Add Lights to the Wheels?

- Earlier builds didn't include these lights
 - -They were never part of the original design
 - -So why were they added?
- Lights were added to address player confusion
 - Some players didn't realize that the wheel would snap to the nearest 45° angle
 - Some players needed to rotate the wheel several times before they reached the next 45° increment
 - This caused confusion and frustration as players thought "The wheel didn't rotate where I wanted it to"

JFo 7-4 Overloading Methods

The Plan to Solve These Issues

- · Add eight lights to each wheel
 - -Lights act as a "tick" mark
 - -They show each 45° increment where the wheel could snap
- A single light may brighten, which shows:
 - -The rotation where the wheel was grabbed
 - -The rotation where the wheel will snap if it's released

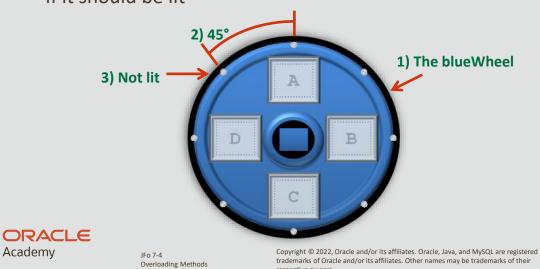

JFo 7-4 Overloading Methods

Light Properties

- A light requires the following properties:
 - -The wheel it belongs to
 - -Its rotation around that wheel
 - -If it should be lit

Academy

Programming the Light Class

• Here's a simplified version of this class:

```
public class UIWheelLight {
    //Fields
    public UIWheel wheel;
    public double rotation;
    public boolean isLit;

    //Constructor
    public UIWheelLight(UIWheel w, double r, boolean 1){
        wheel = w;
        rotation = r;
        isLit = 1;
     } //end Constructor
} //end class UIWheelLight
```

ORACLE

Academy

Calling the UIWheelLight Constructor

A constructor call would look something like this:

UIWheelLight light1 = new UIWheelLight(blueWheel, 45, false);

- But then we thought: "I'm too lazy to type all that!"
 - -There's a legitimate reason for this
 - -It isn't because we're bad programmers
 - -It isn't because we're stupid

JFo 7-4 Overloading Methods

Why It's Great to Be Lazy

- A little math told us ...
 - -There are eight lights on a wheel
 - -One additional light will appear lit
 - -8/9 (or 89%) of lights will be instantiated unlit
 - -89% is a substantial majority
- Therefore, the final argument is redundant and will complicate code 89% of the time
- Complicated code is bad and should be minimized

UIWheelLight light1 = new UIWheelLight(blueWheel, 45, false);

Redundant

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

10

Lights don't actually turn on and off. Instead, when a light should be "on," we instantiate a ninth light and position it on top of the corresponding "off" light.

Overloading Constructors

- You can write more than one constructor in a class
 - -This is known as overloading a constructor
 - -A class may have an unlimited number of constructors
- Each overloaded constructor is named the same
- But they differ in any of the following ways:
 - Number of parameters
 - Types of parameters
 - Ordering of parameters

JFo 7-4 Overloading Methods

Overloaded Constructors: Example

• Implementing this strategy in the UIWheelLight class looks something like this:

```
//Constructors
    public UIWheelLight(UIWheel w, double r){
          wheel = w;
         rotation = r;
          isLit = false;
                                     3 parameters
    }//end Constructor
    public UIWheelLight(UIWheel w, double r, boolean 1){
        wheel = w;
        rotation = r;
        isLit = 1;
    } //end Constructor
} //end class UIWheelLight
ORACLE
Academy

                    JFo 7-4
                                        trademarks of Oracle and/or its affiliates. Other names may be trademarks of their
                                                                                    12
                    Overloading Methods
                                        respective owners.
```

Calling Overloaded Constructors

- An object may be instantiated by calling any of its class constructors
- You supply the arguments, and Java finds the most appropriate constructor

```
UIWheelLight light1 = new UIWheelLight(blueWheel, 45);
```

```
UIWheelLight light1 = new UIWheelLight(blueWheel, 45, false);
```

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Exercise 2

- Continue editing the PrisonTest project
 - -A version of this program is provided for you in the files PrisonTest_Student_7_4.java and Prisoner Student 7 4.java
- Overload the existing constructor
 - -Create your own zero-argument constructor
 - Calling this constructor should initialize fields with the following values
 - -Instantiate an object with this constructor

Variable: p02 Name: null Height: 0.0 Sentence: 0

ORACLE Academy

JFo 7-4 Overloading Methods

Recognizing Redundancy in Constructors

- Very similar code is repeated in these constructors
- It's possible to minimize this redundancy

```
public class UIWheelLight {
    //Constructors
    public UIWheelLight(UIWheel w, double r) {
        wheel = w;
        rotation = r;
        isLit = false;
    }//end constructor

public UIWheelLight(UIWheel w, double r, boolean l) {
        wheel = w;
        rotation = r;
        isLit = l;
    }//end constructor
}//end class UIWheelLight
```

ORACLE

Academy

Constructors Can Call Other Constructors

 By using the this keyword, one constructor may call another

```
public class UIWheelLight {
     //Constructors
     public UIWheelLight(UIWheel w, double r){
        this(w, r, false);
     }//end constructor
     public UIWheelLight(UIWheel w, double r, boolean 1){
         wheel = w;
         rotation = r;
         isLit = 1;
     }//end constructor
}//end class UIWheelLight
ORACLE
Academy
                                            Copyright © 2022, Oracle and/or its affiliates, Oracle, Java, and MySQL are registered
                      JFo 7-4
                                            trademarks of Oracle and/or its affiliates. Other names may be trademarks of their
                                                                                             16
                      Overloading Methods
                                            respective owners.
```

This is helpful because, if the logic in a constructor needs to change, then the code needs to be changed only in one place.

Light Behavior

- Depending on where you click, the yellow light behaves slightly differently
 - If you click the wheel, the light is positioned based on the location of the mouse cursor
 - If you click slot A, B, C, or D, the light is positioned based on the center of that slot

ORACLE Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

How Did We Program This Subtle Difference in Behavior?

- We overloaded the method responsible for positioning the yellow light
- The code looks similar to this:

```
public class UIWheelLight {
    ...
    public void setPosition(double x, double y){
        //Do math
    }//end method setPosition

public void setPosition(double x, double y, UISlot s){
        //Do slightly different math
    }//end method setPosition
}//end class UIWheelLight
```

ORACLE

Academy JFo 7-4 Overloading Methods

Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

18

x and y are the x-position and y-position where the mouse was clicked.

Overloading Methods

- Any method can be overloaded, including ...
 - -Constructors
 - -Methods that model object behaviors
 - -Methods that perform calculations
- All versions of an overloaded method are named the same
- But differ in any of the following ways:
 - -Number of parameters
 - -Types of parameters
 - -Ordering of parameters

JFo 7-4 Overloading Methods

Number of Parameters

 Each overloaded method below has a different number of parameters

```
public class Calculator {

   public double sum(double num1){
      return num1;
   }//end method sum

public double sum(double num1, double num2){
      return num1 + num2;
   }//end method sum

public double sum(double num1, double num2, double num3){
      return num1 + num2 + num3;
   }//end method sum

}//end class Calculator
```

ORACLE

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Type of Parameters

 Each overloaded method below has parameters of different types

```
public class Calculator {

   public double sum(double num1, double num2){
      return num1 + num2;
   }//end method sum

   public double sum(int num1, int num2){
      return num1 + num2;
   }//end method sum

}//end class Calculator
```

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Order of Parameters

 Each overloaded method has parameters in a different order

```
public class Calculator {

   public double sum(int num1, double num2){
      return num1 + num2;
   }//end method sum

   public double sum(double num1, int num2){
      return num1 + num2;
   }//end method sum

}//end class Calculator
```

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Calling Overloaded Methods

 You supply the arguments, and Java finds the most appropriate method

```
public class CalculatorTest{

public static void main(String[] args){
   Calculator calc = new Calculator();

   calc.sum(1, 2);
   calc.sum(1, 2, 3);
   calc.sum(1.5, 4.5);
}//end method main

}//end class CalculatorTest
```

ORACLE

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Exercise 3

- Continue editing the PrisonTest project
- Write a method that prints every Prisoner field
 - -This should be a zero-argument method
- Overload this method to accept a boolean argument
 - -If the boolean is true, this method should call the think() method
- Call both versions of this method on an object

JFo 7-4 Overloading Methods

Recognizing Redundancy in Methods

- Very similar code is repeated in these methods
- It's possible to minimize this redundancy

Academy

JFo 7-4

Overloading Methods

```
public class Calculator{
    ...
    public double calcY(double m, double x){
        double y = 0;
        y = mx;
        return y;
    }//end method calcY

public double calcY(double m, double x, double b){
        double y = 0;
        y = mx + b;
        return y;
    }//end method calcY
}//end class Calculator

Repeated

PRACLE
```

respective owners.

trademarks of Oracle and/or its affiliates. Other names may be trademarks of their

25

Methods Can Call Other Methods in the Same Class

 In this example, one method returns a value to the other

```
public class Calculator{
     public double calcY(double m, double x){
         return | calcY(m,x,0);
     }//end method calcY
     public double calcY(double m, double x, double b){
         double y = 0;
         y = mx + b;
         return y;
     }//end method calcY
 }//end class Calculator
ORACLE
Academy
                                             Copyright © 2022, Oracle and/or its affiliates, Oracle, Java, and MySQL are registered
                      JFo 7-4
                                             trademarks of Oracle and/or its affiliates. Other names may be trademarks of their
                                                                                               26
                      Overloading Methods
                                             respective owners.
```

This is helpful because, if the calculations are wrong or need to be adjusted, then the code needs to be changed only once.

Exercise 4

- Continue editing the PrisonTest project
- Identify and minimize any repeated code in the constructor and display() methods
- Run the program to make sure the program still works properly

JFo 7-4 Overloading Methods

The Method Signature

- A method signature is created from the ...
 - -Name of the method
 - -Number of parameters
 - -Type of parameters
 - -Order of parameters
- As long as one of these differ, a method's signature will be unique

This is the method signature

```
public void setPosition(double x, double y) {
    //Do math
}//end method setPosition
```

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Not the Method Signature

- The method signature does not include ...
 - Name of parameters
 - -Method return type
- Changing either of these isn't enough to overload a method

These aren't part of the method signature

```
public void setPosition(double x, double y){
   //Do math
}//end method setPosition
```

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Matching Method Calls to Signatures

- In this example, counting makes it easy to see which version of sum() should be called
- The method call has three arguments
- Which method signature has three parameters?

```
sum(1, 2, 3);
```

```
public class Calculator {

   public double sum(double num1, double num2){
       return num1 + num2;
   }//end method sum
   public double sum(double num1, double num2, double num3){
       return num1 + num2 + num3;
   }//end method sum
}//end class Calculator
```

ORACLE

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Not Matching Parameter Names

- Can you tell which version of sum() should be called if the parameter names differ?
- You can't
- And neither can Java

```
sum(1, 2);
```

```
public class Calculator {

   public double sum(double num1, double num2){
       return num1 + num2;
   }//end method sum
   public double sum(double x, double y){
       return x + y;
   }//end method sum
}//end class Calculator
```

ORACLE

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Not Matching Return Types

- Can you tell which version of sum() should be called if the return types differ?
- No
- And neither can Java

```
sum(1, 2);
```

```
public class Calculator {

   public double sum(double num1, double num2){
      return num1 + num2;
   }//end method sum
   public int sum(double num1, double num2){
      return num1 + num2;
   }//end method sum
}//end class Calculator
```

ORACLE

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Overload First

- Methods aren't properly overloaded until their signatures differ
- When this is true, then you're welcome to modify the return type and parameter names

```
public class Calculator {

public double sum(double num1, double num2){
    return num1 + num2;
}//end method sum
public int sum(double num1, double num2, double num3){
    return num1 + num2 + num3;
}//end method sum
}//end class Calculator
```

ORACLE

Academy

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Overloading Methods Summary

- Have the same name
- Have different signatures:
 - -The number of parameters
 - -The types of parameters
 - -The order of parameters
- May have different functionality or similar functionality

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Summary

- In this lesson, you should have learned how to:
 - -Understand the effects of multiple constructors in a class
 - -Define overloading of a method
 - -Explain the method signature
 - -Understand when overloading is and isn't possible

JFo 7-4 Overloading Methods Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.
